21 applications dont vous n'allez pas croire qu'elles sont gratuites

par Matt Wolfe

Introduction

Nous entendons constamment parler d'applications IA vraiment cool pour nos ordinateurs et directement dans le navigateur, mais une chose dont j'entends rarement parler, ce sont les applications mobiles vraiment cool qui sont compatibles avec l'IA. Dans cette vidéo, je vais donc vous présenter 21 applications mobiles IA gratuites que vous pouvez utiliser dès maintenant.

ChatGPT

ChatGPT propose deux modes : ChatGPT Plus, qui utilise GPT-4, et la version gratuite standard de ChatGPT, qui utilise GPT-3.5. Si vous avez utilisé ChatGPT sur votre ordinateur, la version mobile fonctionne à peu près de la même manière, mais la grande différence que j'apprécie vraiment, c'est que vous pouvez avoir des conversations avec elle, un peu comme avec Siri, mais en bien mieux.

Pi

Alors que nous parlons de chatbots, j'aime beaucoup le chatbot Pi. Pi est conçu pour être beaucoup plus conversationnel, plus personnel, peut-être un peu moins informationnel. Dans les paramètres du compte, il propose des voix vraiment réalistes. Ma préférée est la voix numéro six. Pi a également la capacité de rechercher sur le Web, vous pouvez donc lui poser des questions et il trouvera des réponses s'il en a besoin.

Perplexity

Perplexity dispose d'un modèle gratuit et d'un modèle payant, mais en utilisant le modèle gratuit, c'est vraiment incroyable pour faire de la recherche. C'est un très bon remplacement à quelque chose comme la recherche Google, si vous avez juste besoin d'informations sur un sujet. Une autre chose que j'aime vraiment dans l'application Perplexity, c'est qu'elle a cet onglet "Découvrir" tout en bas. Si je clique dessus, elle suggère des sujets intéressants à explorer en profondeur.

Character AI

Character AI est tout simplement amusant. Vous pouvez parler à n'importe quel personnage, réel ou fictif, et ce personnage IA croira qu'il est la personne à qui vous parlez. Il n'y a pas beaucoup de cas d'utilisation pratiques pour celui-ci, c'est juste amusant. Même mes enfants

aiment créer des personnages et avoir des conversations aléatoires avec eux. C'est juste un plaisir de s'amuser avec de faux personnages IA pour être honnête.

Socratic

Socratic est en fait de Google et vous pouvez prendre des photos de choses et il analysera les photos et vous aidera à résoudre des problèmes à partir des photos. Par exemple, si je prends ce post-it sur lequel je viens de créer un problème de maths et que je prends une photo rapide, vous pouvez voir qu'il a trouvé le problème de maths. Je vais m'assurer qu'il saisit l'ensemble, puis je vais cliquer sur "Go" et voir qu'il a trouvé la solution. Mais si je clique sur "Résoudre" ici, il décompose la méthode étape par étape qu'il a utilisée pour le résoudre.

Otter

Otter est vraiment très pratique pour les réunions. Disons que vous avez un déjeuner d'affaires avec quelqu'un. Vous prenez votre téléphone, vous le posez sur la table entre vous deux pendant votre déjeuner et vous appuyez sur "Enregistrer". Il enregistre toute la conversation, la transcrit entièrement, sait qu'il y a deux intervenants et divise la conversation entre l'intervenant un et l'intervenant deux. Il vous donnera même un résumé de la conversation et vous pourrez discuter avec la conversation.

Dream

Dream est un générateur d'art IA. Il dispose d'un plan payant, mais si vous cliquez simplement sur le X dans le coin supérieur, il contournera cette fenêtre et vous permettra d'accéder à la version gratuite de l'application. La version gratuite ne génère qu'une seule image à la fois, mais elle produit de jolies images de Stable Diffusion. Ce que j'aime vraiment dans cette application et que je trouve vraiment cool, c'est la fonctionnalité Avatar. Vous pouvez utiliser votre appareil photo, vous regarder et prendre un selfie, puis choisir une invite existante et créer un personnage amusant de vous-même.

Starry AI

Starry AI est une autre application qui propose des plans gratuits et payants. Sur le plan payant, vous n'obtenez que cinq crédits par jour, donc vous ne pouvez pas faire grand-chose avec au quotidien. Mais si vous n'avez besoin de générer qu'une ou deux images de temps en temps, cela fera l'affaire. Il dispose de tous les outils de diffusion stable normaux, comme la création d'une image à partir d'une invite textuelle ou d'une invite d'image ou d'un croquis. Il dispose également d'autres outils d'amélioration des images IA, comme une fonction d'amélioration, un canevas magique et la possibilité de supprimer l'arrière-plan d'une image.

Photoleap, Videoleap et Motionleap

Les trois prochains outils dont je vais parler proviennent tous de la même société, une société appelée LightTricks, qui crée des applications mobiles vraiment cool pour l'édition d'images et de vidéos IA.

Photoleap a une poignée de fonctionnalités similaires à l'application Dream dont nous avons parlé plus tôt. Tout en haut, il y a un menu sur lequel je peux cliquer sur "Outils IA" et vous pouvez voir toutes sortes de filtres IA avec lesquels nous pouvons jouer, comme la possibilité de transformer un t-shirt, d'étendre l'arrière-plan ou de mettre un arrière-plan IA, d'ajouter des tatouages, des costumes, de créer un portrait IA, etc. Je me suis vraiment amusé à jouer avec ce visage caché. Vous téléchargez une image de votre visage et il la transfère dans un paysage urbain.

Videoleap a trop de fonctionnalités pour être abordées dans une seule vidéo, mais vous pouvez ajouter toutes sortes d'effets à vos vidéos. Il découpe également les arrière-plans, mais sur des vidéos, ou vous pouvez changer de scène à l'intérieur des vidéos, ajouter des effets colorés sympas à l'intérieur des vidéos, faire des fonctions de zoom infini ou un panorama IA.

Motionleap est une application vraiment cool pour transformer des images fixes en images animées. Vous pouvez ajouter toutes sortes de superpositions, comme faire pleuvoir dans votre vidéo pendant que le sable remonte, jouer avec le ciel, ajouter des effets de caméra ou des autocollants sur vos images. Toutes sortes de trucs sympas que vous pouvez faire en commençant par une image fixe.

PixaMotion

PixaMotion fait à peu près les mêmes choses que Motionleap, mais je voulais vous montrer une autre alternative qui fait des choses similaires. Vous pouvez animer, ajouter de petits éléments comme ce papillon et ces fleurs qui pendent du haut, qui ont tous été ajoutés après coup. Vous pouvez ajouter des superpositions, changer le ciel, ajouter des effets de caméra ou des autocollants sur vos images.

Colorpop

Si vous aimez vraiment colorier et les livres de coloriage et ce genre de choses, c'est ce pour quoi Colorpop est génial. En bas, vous pouvez voir que nous avons un créateur IA. Si je clique sur le créateur IA, vous pouvez en fait voir une image que j'ai déjà générée une fois aujourd'hui, mais je peux taper "superhéros" et cliquer sur "créer". Une chose ennuyeuse avec cette application est que vous pouvez soit payer pour passer à une version supérieure, soit, lorsque vous générez l'image, elle vous oblige à regarder une publicité, et les publicités sont assez ennuyeuses. Mais une fois que vous avez généré l'image, vous pouvez la colorier directement dans l'application.

Dolby On

Dolby On vous aide à supprimer le bruit de fond de l'audio ou des vidéos, un peu comme ce que vous obtiendriez avec l'outil d'amélioration de la parole d'Adobe. Vous pouvez appuyer sur le bouton d'enregistrement et commencer à parler et enregistrer de l'audio de votre voix directement dans cette application. Il nettoie un peu l'audio. Nous avons quelques outils supplémentaires ici, vous pouvez jouer un peu avec le style, il y a une réduction de bruit supplémentaire, vous pouvez jouer avec le ton, les aigus, les médiums, les basses, vous pouvez l'amplifier. Nous pouvons également couper l'audio. Nous avons également la possibilité

de le faire avec de la vidéo. Cette application est totalement gratuite, donc si vous avez besoin d'un moyen facile de nettoyer votre audio et que vous devez le faire depuis votre téléphone portable, c'est un bon moyen de le faire.

Gradient Music

Gradient Music est comme Spotify mais pour la musique générée par l'IA. Vous lui dites quel genre de musique vous aimez et il génère de la musique IA dans ce style. Il y a toute une série de listes de lecture. Elles devraient être libres de droits, je crois, parce qu'elles sont générées par l'IA. À mon avis, c'est une excellente application pour mettre de la musique de fond dans le style que vous préférez. Personnellement, j'aime beaucoup écouter ce style de musique cyberpunk ainsi que des rythmes lo-fi quand je travaille. Cela me semble être une excellente musique pour la productivité. Et en créant de la musique générée par l'IA, je n'entends jamais vraiment deux fois la même chanson.

Luma

Luma vous permet de créer des Nerfs ou des champs de radiance neuronaux. Il vous permet essentiellement de prendre un grand nombre d'images autour d'un objet, puis il utilise toutes ces images, les assemble et crée une version 3D de cet objet. Vous pouvez en fait faire glisser votre doigt et le voir sous tous les angles. Vous pouvez même dézoomer en pinçant et zoomer en dépinçant. Vous vous promenez simplement autour de l'objet et filmez une vidéo ou prenez un grand nombre de photos, et il les assemble en cet objet 3D.

Arc Search

C'est une application toute nouvelle, sortie quelques jours avant que j'enregistre cette vidéo. Vous pouvez taper n'importe quel sujet et elle recherche essentiellement sur un grand nombre de sites web, extrait un tas de données de ces sites web, puis les compile en une seule page web pour obtenir toutes les informations dont vous avez besoin.

Vous tapez vraiment n'importe quelle invite que vous pouvez imaginer, tout ce sur quoi vous voulez en savoir plus, et elle rassemble une tonne de détails. Voici un autre exemple où nous examinons les Nerfs AI. Nous avons des représentations visuelles des Nerfs en haut, la définition, l'application, le processus, les avancées et à peu près toutes les explications dont vous auriez besoin pour savoir comment fonctionnent les Nerfs, le tout sur une seule page, avec un tas de ressources sur lesquelles vous pouvez cliquer pour en savoir plus sur les Nerfs.

C'est vraiment pratique. Je peux m'imaginer utiliser cette application tout le temps, surtout parce que je fais des vidéos YouTube et que je veux être complet. Je vais probablement entrer n'importe quel sujet dont je vais parler dans cet outil pour m'assurer d'avoir couvert toutes les bases quand je suis sur le point d'en parler.

N.D.L.R

Luma et Arc sont les seules applications des 21 mentionnées qui ne fonctionnent que sous iOS et pas sur Android.

MyMind

Et enfin, je veux parler de MyMind. C'est un outil que j'utilise depuis un bon moment maintenant. C'est comme ça que je sauvegarde tout ce que je trouve sur Internet et que je veux m'assurer de revoir à l'avenir.

En gros, cette application MyMind, si je l'ouvre, vous pouvez voir une gigantesque archive de tous les articles géniaux, vidéos YouTube, tweets, toutes sortes de choses que j'ai sauvegardées du web depuis à peu près un an, presque tout lié à l'IA aussi. Je sauvegarde principalement des trucs sur l'IA ici afin que lorsque je fais mes vidéos, j'ai une énorme base de données de choses potentielles dont je peux parler dans la vidéo.

Voici ce qui est vraiment cool avec cet outil, c'est qu'il utilise l'IA pour aider à étiqueter et créer un résumé de tout ce que je sauvegarde ici. Par exemple, cliquons sur celui-ci, c'est un article de recherche que j'ai sauvegardé de GitHub. En bas, vous pouvez voir ce résumé. Si je clique dessus et l'ouvre, "Act Anywhere introduit un modèle génératif qui automatise le processus de génération d'arrière-plans vidéo adaptés au mouvement du sujet au premier plan". Donc il me donne une explication basée sur toutes les informations de cette recherche. J'obtiens un joli petit résumé d'un paragraphe pour savoir de quoi parle tout ça.

Et puis en bas, vous pouvez voir qu'il a ajouté un tas de tags - données à grande échelle, processus automatisés, modèles génératifs, arrière-plans vidéo conscients du sujet, modèles génératifs - il a ajouté tous ces tags pour moi afin que plus tard je puisse rapidement faire une recherche. Et je n'ai ajouté aucun de ces tags moi-même.

Voici comment j'ajoute réellement des trucs à MyMind. Disons que je navigue sur Twitter ou X ou peu importe comment vous voulez l'appeler. Je trouve quelque chose d'intéressant que je veux sauvegarder. Disons que je veux sauvegarder ce tweet de Boris. Je clique sur ce petit bouton de partage en bas à droite du tweet, ce petit bouton de flèche. Vous pouvez voir que lorsque j'ouvre cette petite boîte, il y a un bouton MyMind. J'appuie juste sur MyMind et il dit "bonne trouvaille, c'est dans MyMind maintenant".

Si je reviens rapidement sur MyMind, que je ferme celui que je regardais, que je fais un rafraîchissement rapide en haut à gauche, le tweet sauvegardé ici est celui que je viens de sauvegarder de Boris. Et ce petit truc de partage fonctionne partout. Je trouve une page web dans Chrome que je veux revoir plus tard, je la partage sur MyMind. Je trouve une vidéo YouTube à laquelle je veux revenir plus tard, je la partage sur MyMind. Un tweet auquel je veux revenir plus tard, je le partage sur MyMind. Des articles GitHub, des pages d'archives, tout ce genre de trucs, je les sauvegarde sur MyMind et il les organise pour moi.

Faisons une recherche sur "Nerf". Vous pouvez voir ici qu'il a affiché tout ce que j'ai sauvegardé en rapport avec les Nerfs et je peux rapidement créer un contenu autour des Nerfs et j'ai tout ce contenu et ces données dans lesquels je peux puiser en rapport avec les Nerfs parce que tout est sauvegardé dans MyMind. Une application vraiment, vraiment utile, quelque chose sans laquelle je ne peux tout simplement pas vivre maintenant pour la productivité. Je l'adore. Je ne

sais pas comment j'ai pu vivre sans avant. Elle est vraiment bien. Je ne peux pas assez la recommander. Également gratuite à utiliser. Ils ont un plan payant mais si je fais défiler vers la gauche, vous pouvez voir que je suis toujours sur le plan gratuit.

Réflexions finales

Et voilà, c'est ce que j'ai pour vous. Ce sont les 21 applications AI gratuites que John et moi avons parcouru le web pour essayer de trouver les meilleures que nous pouvions. Ce sont nos préférées jusqu'à présent, celles que nous avons le plus aimées. Encore une fois, 19 des 21 sont disponibles sur Android, les 21 sont disponibles sur iOS, toutes sont gratuites. Pas 100% gratuites, beaucoup d'entre elles ont des mises à niveau à faire pour utiliser certaines des fonctionnalités supplémentaires, mais tout ce que je vous ai montré dans cette vidéo, vous pouvez le faire dès maintenant sur votre téléphone gratuitement. Donc des trucs assez cool, ravi de partager tout ça avec vous.

Si vous avez aimé cette vidéo, donnez-lui un pouce vers le haut et pensez à vous abonner à cette chaîne et je m'assurerai que d'autres vidéos comme celle-ci apparaissent dans votre fil YouTube. Et si vous ne l'avez pas encore fait, assurez-vous de consulter **future.tools.io**. C'est le site web où je rassemble tous les outils les plus cool que je rencontre, à la fois pour le web, le mobile, Windows, Mac, pour tout. Si je le trouve et que je pense que c'est cool, je le partage ici sur Future Tools. Il y a un tri vraiment facile pour que vous puissiez trouver exactement l'outil dont vous avez besoin. Je tiens également la page d'actualités sur l'IA à jour quotidiennement et j'ai une newsletter gratuite sur l'IA où je vous enverrai simplement les outils les plus cool que je rencontre chaque semaine et les nouvelles les plus importantes que vous devez connaître chaque semaine. C'est totalement gratuit de s'inscrire et lorsque vous vous inscrivez, vous avez accès à la base de données sur les revenus de l'IA, qui est une énorme base de données sur les façons dont vous pouvez utiliser l'IA pour gagner de l'argent en ligne. C'est gratuit pour vous, tout ce que vous avez à faire est de vous inscrire à la newsletter gratuite, ce sera le tout premier e-mail que vous recevrez en guise de remerciement pour votre inscription et vous pouvez tout trouver sur future.tools.

Merci beaucoup d'avoir passé du temps avec moi aujourd'hui et d'avoir partagé ma passion pour les applications mobiles AI cool. J'espère que vous avez apprécié cette vidéo, encore une fois, aimez, abonnez-vous, faites les choses, j'apprécie vraiment, ça aide ma chaîne, ça me fait me sentir bien et ça vous aide à voir plus de vidéos comme celle-ci dans votre fil. Donc merci encore, je vous apprécie vraiment, on se voit dans la prochaine vidéo.

La transcription originale

We hear about really cool AI apps for our computers and directly in the browser all the time but one thing I

rarely hear about is the really cool mobile apps that are AI enabled so in this video I'm going to break down 21 free AI mobile apps that you can use now out of these 21 apps 100% of them work on iOS cuz well that's what I have and two of them don't actually work on Android but the 19 others that I'm going to show you do work on Android and don't

worry I'll let you know when I'm talking about an app that doesn't work on Android my creative director John and I

spent hours testing tons and tons of AI mobile apps and these are the ones that we decided are the ones that you should know about and once again these are all free apps so there are quite a few other

AI apps that are premium you can only get them to do cool stuff if you pay I'm excluding those from this video we'll

get to those in a future video for this one let's just stick with the free stuff starting with the most obvious being

ChatGPT

chat GPT chat GPT has two modes they've got chat GPT plus which uses GPT 4 and just the standard chat GPT free version which uses GPT 3.5 now if you've used chat GPT on your computer this one pretty much operates in the same way but the one major difference about the

mobile app that I really love is that you can have chats with it similar to how you'd have chats with Siri and well

it's quite a bit better than Siri now if you're using 3.5 it's not going to browse the internet it's only going to

give you information from its training data but it's still really cool to have a conversation with it simply hit the

little headphone button to the right of the message box here and then you can have

conversations with it tell me a story about a silly rabbit once upon a

time there was a silly rabbit named Benny Benny loved to hop around the forest but he had a peculiar habit of

trying to jump over every single tree stump he came across and there you go there's the story that it generated for

us and then it jumps straight back to the familiar chat box where we could actually read the story if we wanted now

I cut the story a little bit short because I wanted to keep the pace of the video going but if you want to read the story go ahead and pause the video here

Pi

now while we're on the topic of chat Bots I really like the pie chatbot the piie chatbot comes from a company called

inflection AI whose CEO Mustafa suan used to be a part of Google's Deep Mind

now Pi is designed to be a lot more conversational a lot more personal maybe a little less informational in the

account settings it actually has some really good really realistic voices my personal favorite is Voice number six

hey there great to meet you I'm Pi your personal AI once you've got it working press the little phone icon next to the talk with pi box and you can have a conversation with this one just like we did with chat GPT one of the fun things John and I were doing was having it explained slang to us what does yeet mean ye is a slang term with multiple meanings but it generally expresses EXC
excent Triumph or the act of throwing something here are the main ways it's used um as a verb to discard something with a lot of force a did say she yeed the ball into the trash can once again I did cut off the dialogue just to keep the pace of this video moving but if you want to see the response you can go ahead and pause the video one thing that I also really like about pie is that the voices are kind of soothing I can hear these voices in like a headspace sort of app so if you ever wanted to make some meditations or something like that I would say Pi would be the perfect tool for that K also has the ability to search the web so you can ask it questions and it will search the web to find answers if it needs to what teams are currently still in the NFL playoffs with the 2023 24 NFL playoffs in full swing only four teams remain in the running for the Super Bowl they are Detroit Lions NFC San Francisco 49ers NFC Kansas City Chiefs AFC Baltimore Ravens AFC it's shaping up to be an exciting finish to the season are you rooting for any of these teams no I don't follow football another thing that I find really interesting about pie is its use of breath and ums and things like that instead of just long awkward pauses a lot of times it will use these ums and the sort of breathing sound to fill in the gaps to give it this realism that I really really enjoy next up let's talk about perplexity now perplexity Perplexity does have a free model and a paid model but using the free model it's really amazing for doing research search it's a really good replacement for something like Google search if you just need information about a topic what are the best free mobile AI apps now this one doesn't actually respond with a voice but it does bring us to a response page the best free AI apps for Mobile in 2023 lenza replica chat GPT these apps cover a range of functionalities Etc and then it gives us some extra questions to ask as well as cite some sources of where it got the information that it's sharing another thing that I really like about the perplexity app is that it's got this discover tab down at the very bottom if I click on this it will actually suggest some interesting topics to Deep dive into for example the Messi Ronaldo era ends what's that all about I can click on that it's got some sources available

for me and then explains why this era in football SL soccer is now over now I believe perplexity uses a handful of different AI models inside of the platform and if you upgrade to the paid plan then you can even use GPT 4 and Cloud 2.1 according to this tweet here that came out at the time of this recording perplexity even now has code llama 70b instruct available within its API so I'm not sure if it's available inside the mobile app or not but they are using a combination of different AI models I believe the main model it uses is GPT 3.5 unless you upgrade and then you get additional model options but let's go ahead and just ask perplexity what large language model does perplexity use even in perplexity response it does say the specific large language model used by perplexity AI is not mentioned in the available search results and I can't talk about AI chat models without talking about character AI

Character AI

AI this one is just fun using character AI you can talk to any character real or fictional and that AI character will actually believe it's the person you're talking to like this conversation that I had with Mark Zuckerberg I asked him what's your middle name my middle name is Edward it's a family name I said no it's not I apologize for my error my middle name is actually David not Edward I am human so I make mistakes sometimes don't let it happen again I promise it won't I will ensure that I am more careful and accurate next time are you really a lizard I promise you I am not a lizard I am a human born and raised I eat human food like hot dogs and pizza and I enjoy human activities like walking on two feet I am not a lizard that's exactly what a lizard would say it's also exactly what a human would say I swear I have nothing to do with the lizard Community we don't have any kind of packed interesting conversation Zuck I've also had fictional conversations with Tim Cook hook on here as well as Deadpool cuz why not there's not a ton of practical use cases for this one it's just fun even my kids like getting on this one and creating characters and having random conversations with them it's just actually kind of a blast to screw around with fake AI characters to be honest next up Socratic this one's Socratic actually by Google and you can take pictures of things and it will analyze the pictures and help you solve problems from the pictures so for example I got my camera on right now see there's my computer look hey if I take this sticky note that I just created and I put a math problem on it like $14 * 268$ to the 3 power + 12 and I take a quick snapshot of it let me see if I can get it in

Focus here you can see it found the math problem I'm going to go ahead and make sure it grabs the whole thing and then I'm going to click go and see it found the math problem $14 * 268$ the 3 power + 12 you can see it gave me the solution but if I click solve here it actually breaks down the step-by-step method that it used to solve it so it did $14 * 268$ which is 3752 multiplied it to the third power got this giant number here then added 12 to get the final result if I press the little search icon down at the bottom it brings up a question box and I can ask any question for example how deep is the deepest part of the ocean and I get a response as well as some additional explanations here about the world's oceans I get related videos I get Q&A and I get more info from the web all in a single app I can also scroll up from the bottom when I'm on the app and see all of the various topics that I can dig in with Socratic and this one's 100% free I don't even believe they offer a paid option if you want to next up let's

AI Writer

look at AI writer this is a really quick and easy tool to write up quick messages for various use cases and the cool thing is it's got a whole bunch of prompt templates that you can start with so if I click on choose a prompt template here you can see all of the templates that are already available inside of this these are beginnings of prompts that you can use write an SMS text message write an essay about write an email to so I can say write an email to my boss about taking next week off click these little arrows we've got some preferences down here I've already added some profile information here we can choose a text length short medium or long I've noticed that using short is the best cuz even short still writes pretty long messages and then we've got writing tone I'm going to go ahead and use persuasive let's persuade my boss to give me the week off let's click generate and just like that it writes me an email that I can use to send to my boss to persuade him to give me next week off it can also write replies you input the initial message that somebody gave you and have it automatically write a reply for you so you don't have to think of how to reply and you can rewrite messages which is fairly self-explanatory you plug in an initial text tell it to rewrite it for you in a better way either write bullet points or use formal language or make it shorter whatever click submit you've got a new version of the text written up for you now I've been using this one for free but there is paid upgrades if I click in here there is

some sort of credit system but so far I've used it completely for free and then we have swift key this is one from

SwiftKey

Microsoft and you install it and you don't really actually need to do much inside of the app itself it actually

adds a new keyboard inside of other apps so for example let's say I want to text

John my creative director but let's pretend that John only speaks French he doesn't speak English and I need to send

him a text in French I could press the little Globe icon in the bottom left of my phone here and you can see it added

this new menu bar with the Bing logo and there's a little translate button if I press the translate button I could type

the question I want to ask him like when will the job be done for this week let's go ahead and change the language to to

French hit this little button here and you can see it pasted in my question but in French now I just send the text and

it'll send him a message in French I'm not going to send him this message right now cuz I'm recording this late at night and they'll probably be wondering why

I'm texting them in French but that's how it's done I can also generate images with Dolly directly inside of this app

and send them through text message I just click these four little squares over on the right side you can see we've

got some options like meme camera clipboard but if I click this create option that's directly below the four

squares it says describe the image you like to create let's do a frog jumping on a dog's head you see it will say your

image is being created and after a few seconds I've got a handful of images of a frog on a dog's nose I could select

any one of these images it copies it click into my message box press paste and it pastes it into a message box

where I can now send it to him and just for fun I'm going to go ahead and send it to him John's going to be really confused so some really cool extra

features that you can add just by playing around with this swift key tool next up let's talk about Elsa speak now

ELSA Speak

this one's not super handy if English is your first language like me but I want to share it with anybody who English

might not be your first language because it's an amazing way to get better at speaking English it basically gives you

a daily English lesson so if I click on improve pronunciation it brings me to my

day one lesson here I can click into this click Start nice it pronounces the word and then listens for me to

pronounce it back nice it told me I pronounced it

excellent move on to the next word my biggest wish and just for fun let's go ahead and mispronounce one of these just to see what it does my biggest whiff and it tells me to try again pronounce the sh here with the that symbol apparently that makes the sh sound and then I can obviously say it correctly my biggest wish and now it's excellent it's a great way to practice your English pronunciation if maybe English isn't your first language next up let's talk

Otter

about Otter Otter is really really handy for meetings let's say you have a lunch meeting with somebody you take your phone you set it on the table between the two of you during your lunch meeting and you hit record it records the entire conversation transcribes the entire conversation it knows there's two speakers and it will break the conversation into speaker one and speaker two it will then even give you a summary of the conversation and you can have chats with the conversation so for example here's a demo that they've already got pre-loaded into the app called my recording tutorial you can see it's got the transcripts all the way through uh of this presentation or speech or whatever it is up at the top I can click on summary and see a sort of breakdown of the various topics from the chat I can open any one of these topics see some bullets from that specific portion at the very end there's a tab that says takeaways and there's a button that says otter chat where I can ask it questions otter was I mentioned no Matt wolf is not mentioned in the provided meeting transcript let's ask what is otter good for since this is a tutorial about otter and we get a response based on what was said in the conversation really really handy for notes and meetings all right now we're going to get into some of the AI art tools that are available on your phone and I'm probably going to pick up the pace a little bit with some of these because a lot of these do a lot of things so I'm going to talk about some of the more surface level stuff and I encourage you to dive in and explore these apps even deeper let's start with dream dream is an AI art generator it does have a paid Dream plan the first time you log in it's going to try to get you to pay but if you just click X in the top corner it will bypass this window and let you into the free version of the app if I click on the little Plus at the bottom of the app here I have two options at the top I've got artwork and Avatar artwork is essentially just using stable diffusion and I can generate anything I can imagine here let's go ahead and use one of the example prompts just to keep it

quick glowing crystal Cosmic terrarium if I click on this little magic wand at the bottom of the prompt box it actually extends The Prompt and improves upon it so you can see more detail is now added and then we could choose a style for this prompt just keep in mind some of these styles are only available for the premium paid plan but I've noticed there's a lot of really cool free Styles in here let's go ahead and try Dreamland V3 I'll press return on my keyboard and then I'll click create the free version is only going to generate one image at a time that's why you see the three locks at the bottom but it does produce pretty cool stable diffusion images what I really like about this app that I thought was really cool was the Avatar feature so if I click on Avatar at the very top here I can use my camera look into it and take a selfie and then click next there's the selfie I just took and let's go ahead and pick an existing prompt cuz those are usually pretty good let's do a dark fantasy illustration Etc use our magic wand see if we can expand it a little more and let's create and using a single image with a prompt I get a funny looking character of myself and it actually did the Hat pretty dang well as well I can click the little download button in the top right of the image and download the image you can also download a video that shows the image being created just showing the noise diffusion on it the next AI art tool I want to talk about is star AI this is another StarryAI one that has free and paid plans on the paid plan you only get five credits a day so you can't do a whole lot with it on a daily basis but if you only need to generate one or two images here and there it'll do the trick for you it's got all of the normal stable diffusion Tools in it like create an image from a text prompt or an image prompt or from a sketch it's also got some of these other AI image enhancement tools like an enhanced feature a magic canvas and the ability to remove a background from an image the magic canvas actually uses what's called lat and consistency models to generate the images in real time as you create the prompt so where it says what do you want to see I can type a man and without pressing any buttons it generates a man and if I type wearing glasses it quickly updates the image to the man wearing glasses with a beard and the image just keeps on updating as I update my prompt purple background and I can just keep on typing and it will keep on changing the image based on the text that I'm inputting pretty dang cool and

there's also a background remover built in so if I click on remove background pick an image from my photo album let's just go ahead and use this selfie image that I shot recently and click remove background it's going to scan the image and there's my image with the background removed I can click download and now it's in my camera roll this is an app that I really recommend exploring because there are a whole bunch of different styles available in here and if you're familiar with using something like stable diffusion this generates stable diffusion generated images now the next three tools I'm going to show you are all from the same company a company called LX that makes really cool AI image and video editing apps for mobile the first one is called photo Photoleap leap and it has a handful of similar features to the dream app that we talked about earlier up at the very top there's a menu I can click on AI tools and you can see it's got all sorts of AI filters that we can play with like being able to transform a shirt or expand the background or put an AI background in add tattoos add costumes create AI head shot like the other tool that we just played with AI selfies I really had a lot of fun playing with this hidden face one you upload an image of your face and it transferred it into a city skyline now this one's interesting cuz at first glance you look at it and you're just like okay it's a dark city with a lit up portion in the middle if you squint at it like you kind of got to squint at it to see it but if you squint at it you can actually see my face in the bottom right corner where the traffic is going that's actually like my hand in the corner really really cool effect here's another one with my face inside of a pizza once again on first glance kind of hard to see give it a little squint and it pops right out at you it's very weird but really cool and there's just all sorts of cool features that you could play with here different costumes different selfie features you can play with I want to make my face into like a pop art image I can press pop art get an image that looks like that and again another one that I encourage jumping in exploring there's just way too many different filters and features to play around with next up also from light tricks is video leap as soon as I jump Videoleap in it wants me to upgrade but again just hit the X in the top left and it will get you into the free version tons and

tons of features in this app too many to go through in a single video but you can add all sorts of effects to your videos that we could see on the app here it also cuts out backgrounds but on videos or you could change scenes inside of videos you could add cool colorful effects inside of videos do infinite Zoom features or an AI Panorama this one's interesting cuz you can upload a whole bunch of pictures let me just grab a bunch of random pictures here that are on my phone yep those are all good add to project create Panorama and we'll actually create a video where it just kind of Scrolls between all of the images we just uploaded and makes it look like a single coherent video you can see starts with that one with the background removed and goes onto that random image I made earlier and then a wolf image I made and then a shot from Vegas and it kind of seamlessly Blends between the images to a point where you don't really see the cuts they're not that noticeable it's kind of a cool little effect if we look up at the top here there's tons of templates autoedit merge speed AI recolor various effects various transitions various filters a really cool tool to add various effects to your video and finally I want to talk Motionleap about motion leap which is a really cool app to turn still images into animated images I'm going to go ahead and upload this image of like a sand dun that I took out in the desert here so if I click on animate down in the bottom press the select button the little paintbrush and then sort of Select this area of the sand right here and say I want this sand to have some motion to it go ahead and select it click the direction let's go ahead and make it moving in that direction like that and now if you look at the video you can actually see it's animating the sand and I can speed up the animation as well I can drag that all the way there and now you can see the animation is really showing off let me close out of that so you get a better look at it there's all sorts of other overlays that we can add like we can make it raining in our video as the sand is going upwards we can mess with the sky here let's go ahead and turn the sky pink and just like that look at that we got like a fiery pink sky animated sand and it's raining and all of this started as a still image that's motion Le makes some really really cool video effects let's say you don't have an image to start with you can actually go up to the AI button in the very top prompt an image it will use stable diffusion generate an image and then you can animate the image that you just generated with AI as well but I really like my sandun animation next up

PixaMotion

pixa motion it's going to try to get me to upgrade and pay I'm just going to hit the X and I could use the free version
now honestly this one pretty much does the same kinds of stuff as motion leap that we just played with but I wanted to show you another alternative that does similar stuff you can see you can animate you can add little elements like that butterfly and these flowers that are hanging from the top those were all added in after the fact you can add overlays you can change the sky you can add camera effects or stickers over your images all sorts of cool stuff that you can do starting with a still image so if I click create new grab this image that I have on my phone from the Disneyland Hotel and I can click animate and let's see if we can get the water to do some animation so I can click on the little motion down in the bottom left and let's go ahead and give it this like motion this way I can actually do multiple lines like that let's press play and you can see it's kind of animating a whole bunch of stuff outside of the pool that we don't want it to animate so I can press this little pin button here and put pins in the areas that I want to make sure it doesn't actually animate we just want it to animate the water and nothing else I will make sure that nothing else outside the water is animating and let's see if that looks a little bit better now it's trying to animate just the water my pinning with my fat fingers isn't perfect perfect but you get the idea of what you can do with that we can add overlays I could add little floaty hearts around my Disneyland hotel or heart snow add some bokeh all sorts of cool effects that we can add to our video here which by the way started as an image got extra elements we can add here let's add some energy orbs cuz why not and now we've got an energy orb right in the center of our thing and uh let's go ahead and uh fade that out a little bit make it a little transparent I'm just doing random stuff here a lot that you can play with

ColorPop

next up is colourpop and if you really like coloring and coloring books and things like that that's what coloring pop is great at down at the bottom you can see we've got an AI Creator if I click on AI Creator you can actually see an image that I already generated once today but I can type a superhero and click create now one annoying thing about this app is that you can either pay to upgrade or when you generate the image it's going to make you watch an ad

and the ads are kind of annoying I'm going to watch the ad real quick but I'm going to edit out of the video so you don't have to watch the ad so after a 30second ad it generated this superhero image for me and if I click color I can actually color this in right here on the app so I could select blue make sure we've got the Paint Bucket selected and then I could select his shirt and it will paint his shirt in blue like that and let's make his pants blue let's make the boots black and let's give red tights like so and a red logo my fingers are way too fat for this probably works better on an iPad but you get the idea you basically have a digital coloring book but the image you created is now colorable right inside of the app but I will tell you this app the ads are freaking annoying I don't think I'll get enough use out of it to pay to upgrade it but it forces you to watch so many dang ads and it's such a sh cuz it's a fun cool app to use if they found a less intrusive way to use ads I'd probably use it a lot more cuz I do like the concept A lot again that one was called colourpop Next let's move on to a couple cool Audio Apps for your mobile phone starting with Dolby on and this is one Dolby On that actually helps remove background noise from audio or videos so similar to what you would get from the Adobe speech enhancer tool this one does something very similar so I can press the record button and then I can just start talking and record some audio of my voice straight into this app there's not really too much background noise so it's not going to be very apparent but if I hit stop here's what it sounds like with the noise cleanup turned offing and record some audio of my voice straight into this app and here's what it sounds like it with it turned on there's not really too much background noise so it's not going to be very apparent but if I hit stop it cleans it up a little bit we have some extra tools here you can mess with the style a little bit there's some extra noise reduction so you can turn it way up if there's a lot of background noise you can mess with the tone the treble the mids the bass you can boost it I believe that kind of boosts the volume a bit and then I can just start talking and and it basically gets louder we can also trim the audio down here we've also got the ability to do it with video so I can actually record a video and get the same audio cleanup on the video here and apparently it works for live streams too haven't played with that feature though this one's totally free so if you need an easy way to clean up your audio and you need to do it from your mobile phone this is a good way to do it next up let's talk about gradient Gradient Music

music this is like Spotify but for AI generated music you tell it what kind of music you enjoy and it will generate AI music in that style so if you're really into cyberpunk music I could select the cyberpunk playlist hit play and it will play an AI generated cyberpunk song and there's a whole bunch of the playlist they should be royaltyfree I believe because they're AI generated in my opinion this is a great app for just putting on background music and whatever your favorite style is I personally really like to listen to that cyber Punk Style music as well as low five beats when I'm working it feels like great productivity music for me and by creating AI generated music I'm never really hearing the same song Twice next up let's talk about Luma and this is the first of the two apps that I'm going to talk about it is not yet available on Android it's only on iOS right now but I'm pretty sure it's coming out for Android soon and Luma lets you create Nerfs or neural Radiance Fields

Luma essentially allows you to take a whole bunch of images around an object and then it uses all of those images stitches them together and creates a 3D object version of that thing see I can actually drag my finger around you can't see me dragging my finger around but but as I drag my finger around like this you can actually see it moving on the screen because it's a 3D object and it's got it from every angle here I could even zoom out by pinching and zoom in by un pinching and you can see I can get all sorts of angles on this 3D object and again you just walk around the object and either film a video or take a whole bunch of pictures and it will stitch them together into that 3D object I've used this a bunch of times myself I go to my profile here you can see here's a geode that I actually did a Nerf of when I was in Colorado I can switch to this mode here and actually move my finger around and look at it from all different angles and I can even press the little AR button up in the top right screen and it tries to actually put this thing in my environment so you can see it looks like it's on my desk now and as I move my camera around it looks like it's stationary in the same spot on my desk I even tried to Nerf myself here it's a little blurry cuz my wife actually tried to take all the pictures and I'm a bit taller than her if I look at the top down view of my Nerf here in a second you'll notice I have a giant hole in my head because well she wasn't able to get video or pictures of the top of my head but I attempted to Nerf myself this is the result that's called Luma AI once again only available on iOS at the moment but fairly certain there'll be an

Android version soon the next app is brand new this app came out a few days before I'm actually recording this video

Arc Search

is called Arc search at the moment this is the second app that's only available on iOS no Android yet but also pretty

sure it's coming out for Android soon this one so cool I could type any topic here and it basically searches a whole

bunch of websites pulls a bunch of data from those websites and then compiles it into like a single web page to get all

the info for me so for example I can type San Diego Padres and then if I click this little browse for me button

right here to the right of San Diego Padres you can see reading six web pages Twitter MLB the athletic Wikipedia CBS

Sports Etc and then it gives me this page with an overview of everything I need to know about the Padres here's

some pictures of the stadium some details their home stadium their achievements the notable players

upcoming games franchise history established 1969 uniform changes current season

notable players upcoming games and it gives me a whole bunch of URLs to dive deeper I can come up here and I can even

find out what has it got on me let's type Matt wolf and then do browse for me you can see it's reading a bunch of

pages here it found a couple images of me here that's my profile pick that's like a headshot that I use all the time

occupation digital entrepreneur online presence political involvement wolf ran for Republican candidate for an at

llarge seat on the Philadelphia seat Council TW that one's new to me I don't remember doing that there's more than one Matt wolf though unfortunately

professional background Future tools Thrive cart YouTube Twitter Instagram more stuff on the political Endeavors

which is a different Matt wolf a blog post and some more links to find more about me so you really just type in any

prompt you can imagine any you want to know more info about and it pulls in tons of details here's another one we're

looking at let's do Nerfs AI I'll browse for me with Nerfs here and we were just

talking about with Luma AI we've got some sort of visual representations of Nerfs at the top every once in a while

the images don't load and I don't know why it does that but we've got some visual representations of Nerfs the

definition the application the process advancements and pretty much all the

explanation you would need to know about how Nerfs work all in a single page along with a bunch of resources that you

can click on to learn more about Nerfs this is really handy I can see myself using this app all the time especially

because I make YouTube videos and I want to be thorough so I'm probably going to plug in whatever topic I'm going to talk about into this tool to make sure I've got my bases covered when I'm about to talk about it and then finally I want to talk about my mind this is a tool that I've been using for quite a while now

MyMind

it's how I save anything that I find on the internet that I want to make sure I resurface again in the future basically

this my mind app if I open it up you can see a giant Archive of all of the cool articles YouTube videos tweets all sorts of stuff that I've saved from the web for pretty much the past year pretty much all related to AI too I save mostly AI stuff here so that when I make my video videos I have a giant database of potential things to talk about in the video I come across news articles or research or information it's great to have this to quickly pull it up and find it now here's what's really cool about this tool is it uses AI to help tag and create a tldr of anything that I save in here so for example let's click on this one here this is act anywhere it's a research paper that I saved from GitHub down at the bottom you can see this tldr if I click on this and open it up act anywhere introduces a generative model that automates the process of generating video backgrounds tailored to foreground subject motion so it gives me an explanation based on all of the information in this research here I get a nice little one paragraph summary so I know what this whole thing's about and then down here you can see it added a bunch of tags large scale data automated processes a generative models subject aware video backgrounds generative models it added all of these tags for me so that later on I can quickly search and I didn't add any of these tags myself here's how I actually add stuff to my mind let's say I'm browsing Twitter or X or whatever you want to call it I find something interesting that I want to save let's say I want to save this tweet here from Boris I click on this little share button on the bottom right of the tweet this little arrow button you can see when I open this little box there's a my mind button I just press my mind and it says good find it's in your mind now if I quickly jump back over to my mind here close out of the one I was just looking at do a quick refresh in the top left tweet that saved here is the one that I just saved from Boris and that little share trick works anywhere I find a web page in Chrome that I want to resurface later I share it to my mind I find a YouTube

video I want to come back to later share it to my mind a tweet I want to come back to later share it to my mind GitHub articles archive Pages all of that kind of stuff save them to my mind and it organizes it for me let's search uh Nerf you can see here that it pulled up all of the stuff that I've saved related to Nerfs and I can quickly put together a piece of content around Nerfs and I have all of this content and data that I can pull from related to Nerfs cuz it's all saved in my mind really really helpful app something that I've just absolutely can't live without now for productivity I love it I don't know how I ever lived without it before it it is that good can't recommend it enough also free to use they do have a paid plan but if I scroll to the left here you can see I'm still on the free plan and there you

Final Thoughts

have it that's what I got for you those are the 21 free AI apps that John and I scoured the web for to try to find the best ones we can come across those are the favorites that we found I'll probably make another video in the future with like 20 more because they're rolling out at such a rapid Pace but these are our favorites so far the ones that we've liked the most again 19 out of the 21 are available on Android all 21 are available on iOS all of them are free not 100% free a lot of them have upgrades that you got to do to use some of the extra features but everything I showed you in this video you can do right now today on your phone for free so pretty cool stuff excited to share all those with you if you you enjoyed this video give it a thumbs up and consider subscribing to this Channel and I'll make sure more videos like it show up in your YouTube feed and if you haven't already make sure you check out futur tools. this is the website where I curate all of the coolest tools I come across both for web for mobile for Windows for Mac for all the things if I find it and I think it's cool I share it here on Future tools it's got really easy sorting so you can drill down to just the tool that you need I also keep the AI news page updated on a daily basis and have a free AI newsletter where I will just send you the coolest tools that I come across every week and the most important news that you need to know every week it's totally free to join and when you sign up you get access to the AI income database which is a giant database of ways that you can use AI to make money online it's free to you all you got to do is join the free newsletter it will be the very first email you get as a thank you for signing up and you can find it all over at futur

tools. thank you so much for hanging out with me today and nerding out over cool Ai mobile apps I hope you enjoyed this video again like subscribe do the things I really really appreciate it it helps my channel it makes me feel good and it helps you see more videos like this in your feed so thanks again really appreciate you see you in the next video
